

1

What we have now

6 real documents: a checklist of things to notice, a dictionary of 285 feelings/signs with real example phrases, a rulebook that says which sign combo means which tier, a red-flag list with exact danger phrases, a script for when things are unclear, and sample conversations showing the right tone.

2

Chunking — breaking it into small pieces

We cut each document into small, complete pieces. One sign (like "SIG-002: passive suicidal ideation") = one piece. One rule (like "RULE-001") = one piece. Each piece is already a complete thought, so we don't need to cut it further — we just use it as-is.

3

Embedding — giving each piece a "fingerprint"

For every small piece, we create a kind of fingerprint that captures its meaning, not just its exact words. So "I wish I hadn't woken up" and "I don't feel like being here anymore" get similar fingerprints, even though the words are different — because they mean the same thing.

4

Vector store — the searchable library

All these fingerprints get stored together in one searchable library. Think of it like a library where books are organised by meaning, not by title — so similar ideas naturally sit near each other, ready to be found quickly.

5

Retriever — finding the closest match

When someone talks, the retriever takes what they said, makes a fingerprint of it too, and instantly finds the closest matching pieces in the library. This is fast — it's just comparing fingerprints, not "thinking" with AI.

6

Putting it together: someone talks

Say someone writes: "I just don't feel like being here anymore." The retriever matches this to SIG-002 (passive suicidal ideation) in our dictionary — found instantly, just from the meaning.

7

The rulebook decides what happens next

That matched sign is checked against the rulebook and the red-flag list. If it matches a red flag, the AI skips everything else and immediately uses the exact safety script — no guessing, no delay.

8

The AI responds

For a red flag or unclear situation, the AI uses the exact pre-written script, word for word. For everything else, the AI writes a natural, warm reply using the matched information as its guide — not by memorising a script, but by knowing what to focus on.
