

Mindfully Yours

AI Companion — Progress Overview

Prepared by OpenXcell Technolabs Pvt. Ltd.

What We're Building

Mindfully Yours is an AI companion people can talk to — by voice, text, or an on-screen avatar — about how they're feeling.

It feels like a warm, everyday conversation. Underneath, on every single message, it is quietly checking one thing: **is this person okay, or do they need real help right now?**

Three Rules We Never Break

- 1. Grounded, not invented.** The AI never makes up mental-health advice. It only ever uses what your clinical team has actually written and approved.
- 2. Safety is separate from the AI.** A simple, independent alarm system checks every message for danger — this system cannot be fooled, skipped, or turned off by anything the AI decides.
- 3. It should feel human, never like a test.** No quizzes, no visible scoring. The app quietly understands how serious things are just from natural conversation.

The Big Picture — How the System Is Built

The AI Companion Engine is kept as its **own separate piece**, deliberately. That way, nothing happening anywhere else in the app can ever interfere with the safety checks.

How One Conversation Works

The safety check step **never gets skipped** — not for speed, not for cost, not ever.

Organizing Our Knowledge — 3 Simple Categories

Everything your clinical team has given us gets sorted into exactly one of three groups:

Category	In plain words
Teach the tone	Example conversations that show the AI how to talk — warm, calm, natural
Find the right answer	Real information the AI searches through to understand the person and offer real help
Follow the rules	Fixed decision rules (like "these signs mean this level of concern") the system checks directly — no guessing

This keeps everything fast, accurate, and easy to update as your team sends us more material.

What We've Built So Far

Area	Status
Full project understanding & documentation	Complete
Organizing all knowledge base material received	Complete
Turning your spreadsheets & documents into usable data	Complete
Danger-phrases detection (the core safety check)	Complete
Secure data storage design	Complete
Full conversation flow — structure & sequencing	Complete
Silently understanding what a person means	In progress
Deciding severity automatically	In progress
Connecting to the AI voice/language provider	In progress
Full end-to-end testing	Not started yet

A Recent Milestone

Your team's clinical content team recently shared a large batch of working documents — question banks, conversation examples, and self-help materials.

We reviewed every single file and found:

- **Real, ready-to-use self-help tools** (a complete coping-skills workbook) we didn't have before
- A few **small data-quality issues** already cleaned up
- A short list of **simple questions for your clinical team**, to make sure a few of your documents are read exactly the way you intended

What's Next

1. Finalize the connection to our AI voice/language provider
2. Get quick input from your clinical team on a short question list
3. Build the remaining "understanding" logic
4. Full testing before anything goes live

Thank You
